EDISON PLANS AN AUTOMATIC CLERKLESS SHOP

There Will Be No Waiting for Change, No Impolite Helpers, No Counters, but Customers Will Get What They Want on the Slot Machine Plan.

THOMAS EDISON IN HIS WORKSHOP.

A new automatic store is to be opened in the near future in which goods will be sold by machinery alone, without the intervention of any human beings. This store is said to be the brainchild of Thomas Edison, the inventor, and its opening is expected to take place shortly. The store will operate on a slot machine plan, in which customers will insert coins into a machine, which will then dispense the desired goods.

The store will be located in a building that will be equipped with a series of machines, each of which will be designed to dispense a specific type of product. Customers will be able to select the product they desire using a card or a ticket that will be issued to them by the machine. The machine will then dispense the product, which will be placed in a bag or a container, and the customer will receive it.

The store will also feature a payment system that will allow customers to insert coins into the machine, which will then count the coins and dispense them as needed. This system will be designed to prevent customers from stealing goods or using the machines for unauthorized purposes.

The store is expected to be very popular, as customers will be able to buy goods quickly and easily, without the need for human intervention. The store is also expected to be very efficient, as it will be able to dispense goods 24 hours a day, without the need for staff.

The store will feature a number of unique features, such as a system for restocking the machines automatically, and a system for disposing of broken or damaged goods. The store will also feature a system for tracking the inventory of the store, which will be updated in real-time.

The store is expected to be a major success, and it is expected to revolutionize the way that goods are sold in the future.
