WILL VACCINE BE THE GREATEST CURE IN MEDICAL SCIENCE?

Experimentation Proves That It Is Effective in Many Diseases Formerly Not Included Within its Scope.

Dr. Frank Billings.

"The revelations of modern-day medical science seem to point toward the fact that all diseases of the body are caused by viruses, and that vaccines, sera, and extracts of hogs, accompanied by beneficial herbs, are the cures of the future.

A few months ago The Times published an exhaustive account of the beginning of the work of Dr. G. D. Dwyer, a physician in New York. His work has been noted in leading medical journals in this country and abroad. In recent months contain original articles telling of the development of this product of great medical importance.

As a result of this work Dr. Dwyer has been called upon by many eminent physicians in this country and abroad to try their cases and to report the results. The cases have been varied and the results have been uniformly satisfactory. The Dr. Dwyer vaccine has been found to be effective in all cases, whether acute or chronic, and whether mild or severe.

The vaccine has been used with great success in the treatment of many diseases, including typhoid fever, typhus fever, scarlet fever, diphtheria, and many other diseases.

The vaccine is made from a special strain of the virus, which is cultivated in the laboratory under the most rigid conditions. The vaccine is then filtered and sterilized, and is administered by injection into the patient. The vaccine is not fatal, and the patient recovers quickly and completely.

The vaccine is easy to administer and is well tolerated by all patients. It is not necessary to fast the patient before or after the injection, and the patient can return to his usual activities immediately after the injection.

The vaccine is not only effective in the treatment of diseases, but it is also prophylactic. It is recommended for the prevention of many diseases, including measles, mumps, rubella, and chickenpox.

The vaccine is available in all parts of the country, and is sold by all reputable medical dealers. It is not necessary to consult a physician in order to obtain the vaccine.

The vaccine is a great advance in medical science, and it is expected that it will be widely used in the treatment and prevention of diseases.
