THE HUMAN AURA HAS AT LAST BEEN PHOTOGRAPHED

A few months ago it was announced by Dr. W. J. Kilner of London that he had succeeded in photographing the "aura" of persons on a sensitized plate. The term "aura," which has been used by philosophers, mystics, and artists for centuries, refers to an ethereal glow or light that surrounds the body of a person. Dr. Kilner's achievement was significant because it provided a scientific basis for understanding the aura.

Dr. Kilner, a physician and researcher, used a special camera to capture images of the aura. The camera was equipped with a sensitized plate, which was exposed to the aura until it developed. The result was a photograph that revealed the shape and color of the aura.

The aura is believed to be a spiritual or energetic field that surrounds the body. It is thought to be an expression of a person's health, emotional state, and overall well-being. The aura is often depicted in art as a halo of light that surrounds the body, and it is said to change in appearance depending on a person's mood and emotions.

Dr. Kilner's work has sparked interest in the study of auras and has led to further research in the field. The ability to photograph the aura has opened up new possibilities for understanding and exploring this mysterious phenomenon.
