A GREAT SIXTY-INCHE REFLECTOR WHICH PHOTOGRAPHS THE STARS

By Mary Proctor.

At last one of the great astronomical instruments has been completed; for we have seen the great solar observatory, which has now been established on the top of Mount Wilson. Like the planetarium, the observatory is built along the hillside, where the rocks are steep and the air is cool. The great telescope is the telescope of the institute at Mount Wilson, California.

The construction of such an instrument is a long and laborious process. The great telescope is the result of the work of many years. The first step was to obtain the necessary funds for the construction of the telescope. The next step was to select the site for the observatory. The site was chosen at the top of Mount Wilson. The third step was to build the observatory. The observatory is now complete.

The telescope is the work of the great astronomer, Professor Eddington. It is the largest telescope in the world. It is a reflecting telescope, and it has a great magnifying power. The telescope is a magnificent instrument, and it is a great source of pleasure to all who use it. It is a wonderful instrument, and it is a great source of knowledge.

The telescope was completed in 1910. It is now in operation, and it is being used to study the stars. The telescope is a wonderful instrument, and it is a great source of knowledge.

The telescope is a marvel of precision. It is a wonderful instrument, and it is a great source of knowledge.

The telescope is a wonderful instrument, and it is a great source of knowledge.

The telescope is a wonderful instrument, and it is a great source of knowledge.

The telescope is a wonderful instrument, and it is a great source of knowledge.
